The Black design and its countershapes are looking good. Thank you for also sharing the first conjuncts; it is good to see them already in action. Little things are jumping here and there to my eyes; my comments are questions around some of the design decisions.

Weight and Width

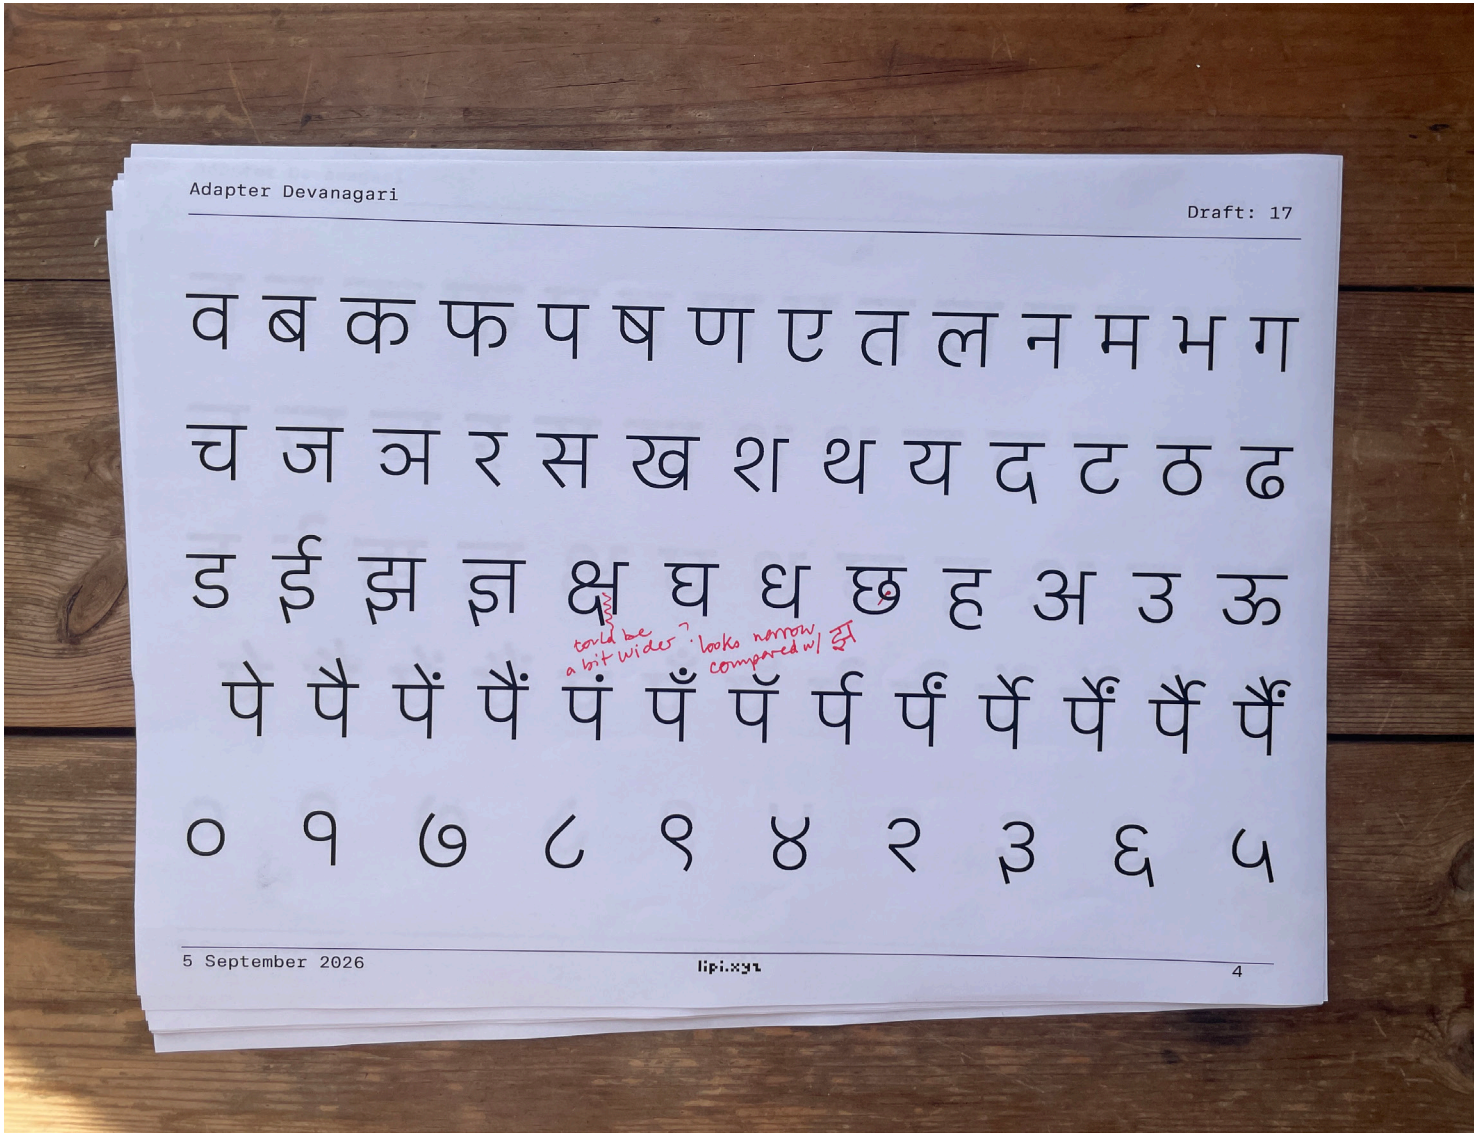

- The inner space of KSsa looks tight (and therefore the whole glyph narrow) in the xLight M, when for instance compared to the proportion scale of Jha.
- The bottom part of the loop in Cha seems a tad fragile, in xLight and Medium Ms.
- Ttha seems a little shaved off its right hand side, in the Black M.

Above Rekha

- The spacing/placement of Anusvara looks too tight in the xLight and Medium Ms.
- The Black M eMatra looks short when combined with Reph. I am wondering if a slight angle modification could help eMatra catch a little bit more light, when combined.

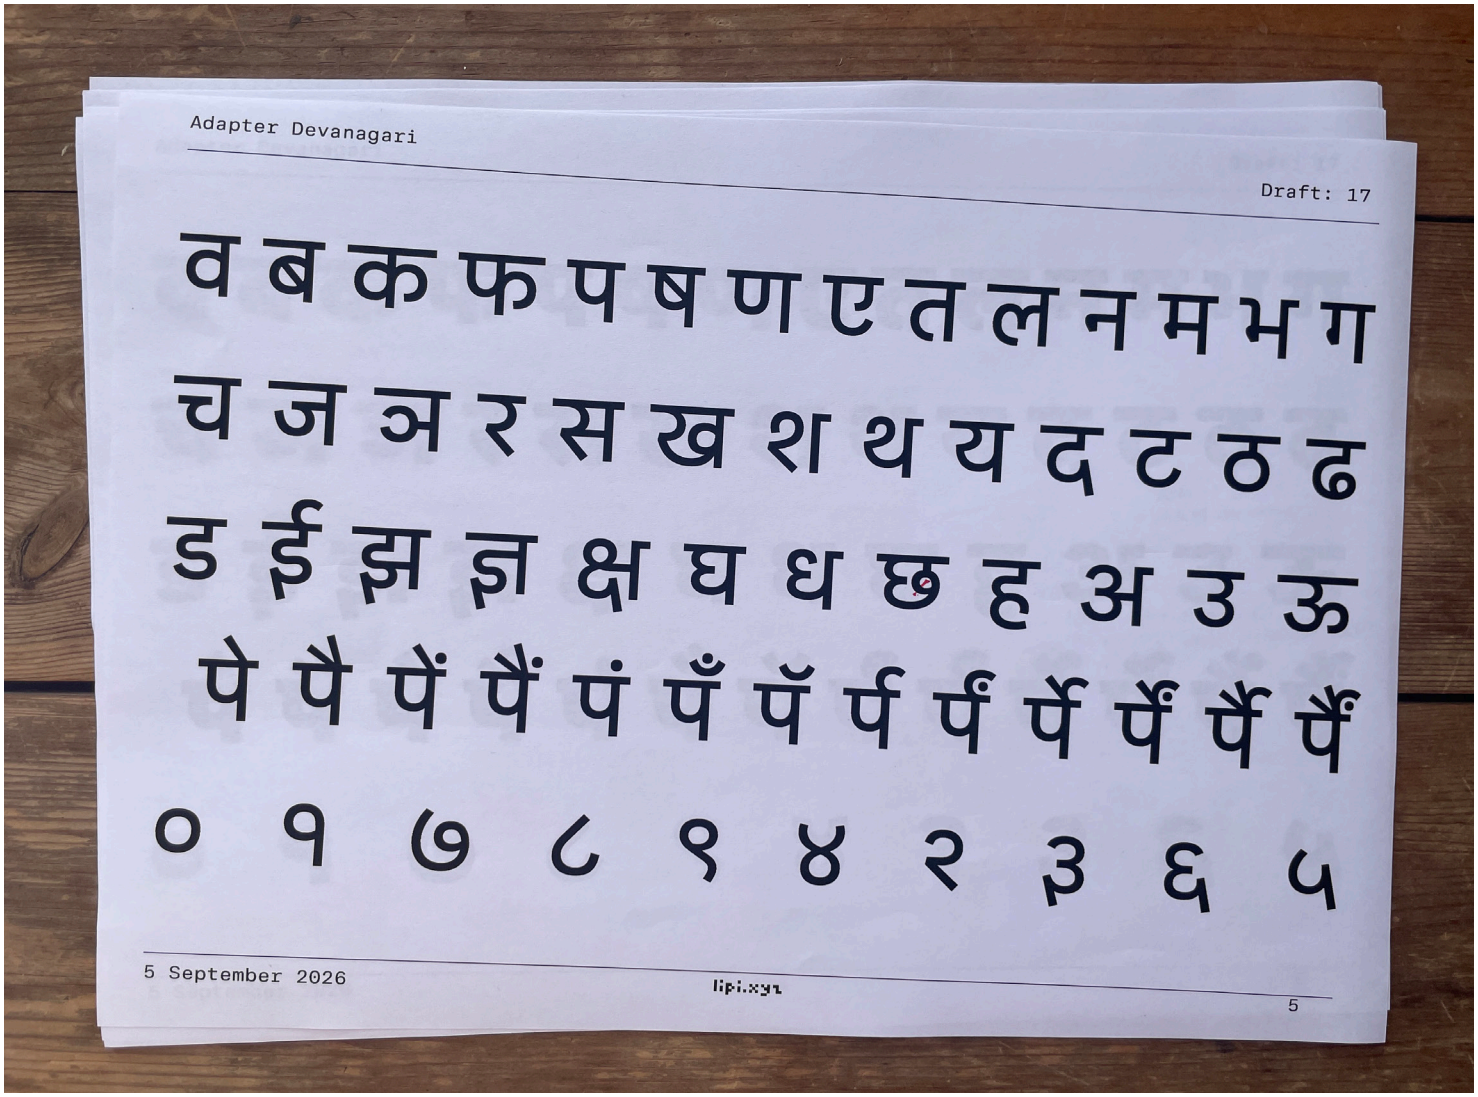

Conjunct construction

- The width of KSsRa appears narrow in the xLight M (see also my prev. comment on KSsa).
- The leg of KhRa looks fragile in the xLight M.
- The leg of DhRa looks also a little light in the xLight and Medium Ms.
- JRa, MRa and JhRa have very short stem on the baseline. Further, I wonder if the leg in MRa could be connected higher onto the stem.
- The MRVa leg looks very long.
- The leg of DRa comes in straight and fill the connection, unlike in KhRa.
- The width of S in STha and SJa seems a little narrow, in all Ms.
