
The fifth round looks at the design as a whole, Light and XBold masters with their interpolated instances.

DESIGN A few things caught my eye while reviewing the latest version. I've noted them below. Further notes are to be found on the annotated proofs.

- Nna feels slightly wide at the moment. The space between the arch and the vertical stroke seems a touch generous, and the arch itself feels somewhat width-close to the proportions of Pa.
- Ta might benefit from a little more shoulder. In comparison, La seems to carry this feature a bit more naturally.
- Ja appears slightly small to me. I wonder whether it could extend a little further downward.
- In the first round, Jha and KSsa had straight strokes. I found that approach quite convincing, and I wonder if it might be worth revisiting. The same applies to the vocalic R, which feels a little unusual in its current form.
- Kha feels slightly large. Perhaps the round component could be reduced a little further, which would also help reinforce the distinction from Ra and Va.
- In Uu, the matra appears to lean slightly to the right, giving the impression that it is tipping over.
- Cha currently has an open counter. Since Ddha is now closed, I wonder whether there could be an argument for treating Cha in a similar way. Cha could be a tad wider too.
- The construction of the reph has a pleasant roundness to it, whereas MatraI and MatraIi emerge more directly from the shirorekha. I wonder whether there is an

opportunity to bring these approaches a little closer together, or whether the current contrast between them is intentional.

— The Devanagari figures strike me as somewhat wide, both in relation to the Deva letters and to the Latin figures. Is there a reason for wide figures? Out of curiosity, do you expect these figures to be mixed with Latin figures in practical use? I think we already talked about that previously.

— In the bold master, `reph_anusvara` caught my attention because its contrast feels a little stronger than I expected. It might be worth exploring whether a slightly more even weight distribution would help it sit more comfortably with the rest of the bold design.

— In the bold, the crossbars in `Ba` and `Ssa` appear slightly heavy at the moment. It may be worth exploring a slightly thinner treatment.

SPACING Thank you for setting up the spacing strings. They provide a very helpful foundation for reviewing the spacing across the script.

While going through them, I noticed a few small areas that might benefit from further adjustment. Nothing major, but perhaps worth a second look.

One thing I wondered about is that the current strings do not seem to show the entire base set enclosed between two vertical stems. It might be useful to run through the remaining glyphs as well and, eventually, build a larger, fairly straightforward spacing document that covers the full character set. I find that this kind of systematic review often helps reveal small inconsistencies that are otherwise easy to miss.
